
JJ ONYX

Builder. Trader. Storyteller.

PORTFOLIO DECK · 2026

THE DUALITY

Joseph James — JJ — is an eighteen-year-old fullstack developer from Addis Ababa, now building and operating real-time systems out of Dubai. On one side of the mind: Next.js, TypeScript, Postgres, WebSockets and Prisma, shipping production platforms — a seven-portal restaurant ERP, an AI attendance system for schools, an AI exam-prep academy — all as a founder.

On the other side: the markets. JJ trades forex and streams the desk live, bringing a trader's instinct for latency, risk and real-time data into every system he engineers. The developer builds the infrastructure; the trader stress-tests it against reality. Both run on the same discipline: ship it live, keep it honest.

“One mind. Two markets.”

TG's Restaurant ERP

A real-time ERP running a delivery-only Ethiopian restaurant in Dubai.

PROBLEM

TG's is a delivery-only Ethiopian restaurant in Dubai — no dining room, no walk-ins. Every order arrives by phone call, WhatsApp voice note, or the web, and operations were run the way most restaurants run: memory, paper tickets, and shouting across the kitchen. As volume grew, so did the failure modes — missed voice notes, double-entered tickets, drivers dispatched on stale information. Every new staff member made things slower, not faster. There was no shared source of truth between the person taking the order, the chef cooking it, and the manager answering "where is my food?" at 9pm.

SOLUTION

A unified, real-time multi-portal ERP covering the full order lifecycle: intake, kitchen, dispatch, finances — even the weekly customer lottery that keeps regulars coming back. Every role gets a purpose-built portal; every portal sees the same truth at the same moment. A voice note sent on WhatsApp becomes a structured ticket on the kitchen display before the customer hangs up.

STACK

pnpm monorepo	React + Vite	Express	PostgreSQL · Supabase
Socket.IO	JWT · RBAC	Twilio Voice	Google Drive API

IMPACT

7 Connected portals	<1s Order sync	24/7 Live kitchen ops

ATTENDX⚡

AI-powered attendance & student safety for schools.

PROBLEM

Roll call hasn't changed in a century: a teacher reads forty names, forty students answer, and ten minutes of teaching time disappears. Paper attendance sheets then sit in a filing cabinet — no analytics, no trends, no early warnings for students quietly drifting away. Worst of all: parents find out their child never arrived — hours late, or never. In an age where a food delivery can be tracked to the door, a parent's most important question — "is my child safe at school?" — was still answered with silence.

SOLUTION

ATTENDX⚡ replaces the register with multi-modal check-in: AI face recognition at the gate, QR codes on student ID cards, or fingerprint verification where biometrics are preferred. Every check-in lands in a secure cloud database in real time — encrypted credentials, environment-variable secrets management, and role-based access keeping student data locked down. A parent knows their child arrived safely — before the bell finishes ringing.

STACK

AI face recognition	QR check-in	Fingerprint	Realtime cloud DB
Automated SMS	Encrypted credentials	Env-based secrets	Live analytics

IMPACT

3 Check-in modes	≤5s Parent alert time	100% Automated SMS

JJ NEXUS PRO

A forex trading & live-streaming powerhouse.

PROBLEM

Trading and streaming pull you into five different tools: one app for charts, one for broadcast, one for research, one for chat — and one for hope. Every context switch is lost focus, and focus is the entire game. Streamers in markets have it worst: OBS scenes, capture cards, browser sources and market feeds stacked into a Rube Goldberg machine that dies the moment one piece hiccups.

SOLUTION

JJ NEXUS PRO is the answer — a single command center where the market feed, the broadcast pipeline and the research desk live side by side. Open one tab and you're live: chart on the left, stream controls on the right, COT positioning below. The browser tab becomes the broadcast studio.

STACK

React + Vite	TypeScript	Node · Express	WebSocket
FFmpeg	PWA	GitHub Codespaces	Market data proxies

IMPACT

RTMP Browser → live	Multi Data sources unified	COT Signal models

Learnyx Academy

AI-powered national exam prep for Ethiopian students.

PROBLEM

In Ethiopia, the EHEEE — the national exam — decides university placement and, honestly, trajectories. But preparation is radically unequal: private tutoring exists for a few, outdated PDF photocopies for everyone else. The students with the most ambition often have the fewest tools. Study apps imported from abroad don't understand the curriculum, the language reality, or the exam itself. Students needed something built for their exam, not a translated afterthought.

SOLUTION

Learnyx Academy is a full learning ecosystem for grade 9–12 students: an AI tutor that actually explains, quizzes and flashcards structured by subject, live study rooms where friends keep each other accountable, and an XP system that makes showing up daily feel like leveling up. Consistency is the hardest subject — so we made it a game worth winning.

STACK

Vite + React	TypeScript	Convex	Groq
LiveKit	Cloudflare R2	Freemium auth	Render

IMPACT

AI Groq-powered tutoring	Live Study rooms (LiveKit)	XP Gamified consistency
------------------------------------	--------------------------------------	-----------------------------------

STARTUP VISION

Every system starts in Addis Ababa and ships outward. The trajectory runs across four domains — restaurants, education, markets, media — each one a real operation with real users, built alone end-to-end and run in production. No pitch decks: infrastructure first, revenue on top, story told live.

“Build where you stand. Ship what works. Scale from Addis outward.”

FOUR DOMAINS — STATUS
